Realtime Database ? Hosting ? Authentication ? Storage ? Cloud Messaging ? Remote Config ? Test Lab ? Crash Reporting ? Notifications ? App Indexing ? Dynamic Links ? Invites ? AdWords ? AdMob What sort of apps is Firebase good for? There's really no limit to the types of apps that can be helped by Firebase products. There are only limits to the platforms it can be used on. iOS and Android are the primary targets for the Firebase SDKs, and there's increasing support for web, Flutter, Unity, and C++. You should also know there's an Admin SDK available for a variety of languages, to be used with any backend components you might require. On top of those SDKs, there's a library called FirebaseUI (Android, iOS, web) that provides a bunch of helpful utilities to make development with Firebase even easier. And there are also projects such as AngularFire that wrap the web SDKs for use with Angular. These are open source.
